

11/12/2025 Professor Mukherjee-Dr. Wester-Yves Greatti
Meeting Minutes

We confirmed that the project will focus on evaluating the association between clinical variables—currently being defined—and a three-level categorical outcome describing visual impairment before and after surgery (“worse,” “better,” or “unchanged”). The initial cohort will include approximately 80 patients, with the possibility of expanding to around 200. The deep-learning model used for craniopharyngioma segmentation will be incorporated alongside the clinical variables to assess whether imaging-derived features can improve predictive performance.
